Sensor MUT 1000 EL

MUT 1000 EL sensors represent the state of the art of EUROMAG INTERNATIONAL production for water cycle and process applications.

The new structure for the generation of the magnetic field, the innovative route of the signal generated by the electrodes, is giving a sensor with an extremely wide measurement range, keeping the extremely compact dimensions.

EL= Extended Linearity.

This new sensors series follows the successful tradition of the MUT 1000, introducing a measurement range of more than 1:1000 without linearization software.

These kinds of performances allow doing very accurate measures on a wide flow rate range and to count lower flow rates that before would have been reset because of the effect of the converters cut off.

This flanged sensors series bases its operation on the Faraday Principle, by which a conductor crossing a magnetic field generates a potential perpendicularly orientated to the same field. In this case the flow tube made in stainless steel AISI 304, two coils are installed on the top and inferior part; the magnetic field, generated by the electric current crossing the coil, induces in the electrodes a difference in the potential proportional to the flow rate. With the aim of measuring such potential of very low values, the interior of the flow tube is electrically insulated, thus the process liquid is no longer in contact with the material of the flow tube.

The converter used generates the current supplying the coil, acquires the electrodes difference of potential, processes the signal to calculate the flowrate and manages the communication with the exterior.

The entire sensor, when installed in the separate version, has a degree of protection IP 68 suitable for a permanent immersion in water up to a depth of 1.5m, thanks to a welded plate structure containing the coil and the electrodes.

1. Body and connection

MUT 1000EL SENSORS have the flow tube made in stainless steel AISI 304 and the structure is made in acrylic painted carbon steel. This treatment gives the sensor an excellent resistance to water, even in permanent immersion. It is equipped with a junction box to connect the cables to the converter. Its standard degree of protection is IP68, suitable for a permanent immersion in water at 1,5m. It is installed between flanges UNI 2223 from PN 16 to PN 40 or between flanges ANSI 150, 300.

2. Internal lining

The standard internal insulating lining is in PTFE for diameters from ND 25 to ND 150, in hard rubber for food stuff (ebonite for food) for diameters of more than ND 150. On request the sensors may be supplied coated with PTFE for diameters of more than ND 150. The temperature of the liquid to be measured is limited by the kind of internal lining used.

3. Electrodes and grounding

The standard electrodes are in Hastelloy C and, therefore, guarantee a wide compatibility with the process liquids, if required they may be supplied in the materials shown in Table 2. If these sensors are inserted in a plastic or lined pipe line, they require the use of two grounding rings for the liquid, which are inserted at each side of the sensor or the installation of the grounding electrode.

An empty pipe electrode may also be provided on request to monitor conditions of partly filled pipe.

4. Coupling and connecting to sensor

MUT 1000 EL sensors may be coupled with any EUROMAG converters shown in Table 3. In the separate version the sensor is connected to the converter by means of two cables whose length depend on the liquid conductivity; the maximum length not exceeding 100 metres as shown in Figure 1.

5. Choice of diameter

In order to select the correct diameter use figure 3, the recommended full scale velocity, in normal applications, is around 2÷3 m/s. It should be noted that the full scale flowrate can be selected in the field through the converter keyboard. The maximum value that may be selected is the one corresponding to a velocity of 10 m/s.

6. Maximum temperature of the liquid

In the separate version the maximum liquid temperature allowed is 180°C. In the compact version instead, the maximum temperature allowed depends on the ambient temperature. This is due to the required cooling of the electronics. The maximum liquid temperature allowed for the compact version should be 80°C. Maximum operating temperature for ebonite lined sensors is 80°C.

7. Calibration and maximum error

MUT1000 EL sensors belong to the reference Group B1 (ISO 11631). Each sensor is calibrated by a hydraulic bench equipped with a reference weighting system and SIT certified. The uncertainty of the measure is equal to 0.2% of the read flowrate value when the velocity of the liquid is more than 0.2 m/s. The repeatability of the measure is in the order of 0.1%.

8. Reference standards

The EUROMAG magnetic meters are marked CE and are manufactured according to the following standards:

- * CEI EN 61010-1
- * UNI EN ISO 6817
- * EN 1434
- * EN 50081 - 1
- * EN 50082 - 1
- * 2006/95/CE, 93/68 (LVD)
- * 2004/98/CE, 92/31 (EMC)
